

Project Roadmap

THE 6 KEY STEPS

Launching a new analytical solution requires rigor, coordination, and responsiveness. From initial data exploration to user feedback, each step plays a key rôle in the project's success.

1. Data Analysis

Objective :

Analyse the dataset structure, identify key variables, detect inconsistencies, and extract meaningful business insights to define a clear analytical direction.

2. Work Environment

Objective :

Set up a stable and reproducible development environment, manage dependencies properly, and ensure version control and testing infrastructure are operational.

3. Algorithm Development

Objective :

Design and implement the core analytical logic, including data processing, feature extraction, and exploratory or decision-support functionalities.

4. User Assistance

Objective :

Simplify model visualization and improve user navigation by offering multiple selection criteria for each question and grouping model searches to make dataset exploration clearer and more accessible.

5. Official Launch

Objective :

Ensure the dataset is fully exploitable by associating each variable with a clear definition and increasing the number of visible graphical outputs available to the user.

6. Continuous Improvement

Objective :

Continuously refine the README documentation and update the project flowchart to maintain clarity, structure, and long-term maintainability.
